

Thermo Scientific Nunc UpCell Surface

Features and Benefits

Preserving Cell Surface Proteins

The Thermo Scientific Nunc UpCell Surface enables harvesting of cells with high viability and intact surface proteins for culture passaging, single-cell analyses and cell transplantation research.

- No trypsin preserves cell surface proteins
- No scraping get high cell viability
- Minimal hands-on time
- Quick, clean and simple just reduce the temperature

Cell harvesting using enzymatic digestion, such as trypsinization, results in degradation of cell surface proteins. These proteins are important for the interactions between the cell and the environment. For example, cell surface proteins are involved in the cell's response to the extracellular matrix, to other cells and to growth factors and other soluble mediators. Some cell surface proteins are involved in the ion homeostasis of the cell, whereas other cell surface proteins are used as antigens or markers in cell analysis and enrichment procedures.

by trypsinization

Cells harvested

Cells harvested from UpCell Surface by temperature reduction

Creating 3D Tissue Models

The UpCell[™] Surface enables harvesting of cell sheets and creation of tissue models held together by normal cell junctions and extracellular matrix deposited by the cells.

- No scaffold make 3D tissue models without exogenous material
- No uneven cell distribution control the spatial distribution of cells in 3D
- Endless possibilities for mixing cell types and creating 3D co-cultures
- Just harvest and stack cell sheets

In tissue engineering, three-dimensional (3D) tissue models or transplants are typically prepared by seeding a cell suspension on a pre-fabricated scaffold. Scaffold materials are not produced by the cells to reside in the engineered tissue, and are most often materials foreign to the body or from another species (xenogeneic), such as, poly lactic acid (PLA), poly glycolic acid (PGA), alginate, gelatin and collagen. Problems often encountered using scaffolds for tissue engineering include uneven cell distribution and difficulties in controlling the spacial distribution of different cell types. After transplantation, there can be host inflammatory reactions and fibrous tissue formation due to the exogenous scaffold material.

Tissue engineered using scaffold

Tissue engineered using UpCell Surface

Thermo Scientific Nunc UpCell Surface Temperature-Responsive Cell Culture Surface

UpCell Surface is designed to respond to changes in temperature. It releases adherent cells by a simple reduction of the temperature of the cell culture. Products with UpCell Surface include Thermo Scientific Nunc MicroWell plates, multidishes and dishes.

The covalently immobilized polymer poly(N-isopropylacrylamide), or PIPAAm, forms an even and thin layer on the cultureware. The PIPAAm layer is slightly hydrophobic at 37°C, allowing cells to attach and grow. When the temperature of the culture is reduced to below 32°C, the PIPAAm layer becomes very hydrophilic, binds water and swells, resulting in the release of adherent cells.

Extracellular Matrix is Harvested with the Cells

Depending on the degree of confluence of the culture, and the harvesting technique, single cells or cell sheets can be harvested from the UpCell Surface. Because the extracellular matrix under the cultured cells is harvested with the cells, cell sheets are naturally adhesive to other cell sheets and to cell surfaces in the body.

Working with Single Cells

Single-cell suspensions harvested from cultureware with Thermo Scientific Nunc UpCell Surface can be

- Analyzed *in vitro*, for example, by flow cytometry
- Manipulated to purify certain cell types
- Re-seeded in cultureware with UpCell Surface or traditional cell cultureware as part of a passaging procedure
- Used in cell transplantation research

Grow your cells in cultureware with UpCell Surface, reduce the temperature, and harvest your cells. It is that simple!

The Nunc UpCell Surface enables harvesting of cells with high viability and intact cell surface receptors and antigens. Even harvest cell types that are difficult to detach by other methods, and keep unwanted cell activation to a minimum.

Traditional cell harvesting by enzymatic and mechanical methods often compromises the integrity of surface proteins and the viability of harvested cells. By contrast, UpCell Surface allows cell harvesting by simply reducing the temperature of the cell culture, resulting in cell populations with preserved cell surface proteins and high cell viability – and there is no need for enzyme removal or inhibition.

Examples of applications using single-cell suspensions harvested by temperature reduction

Cell Туре	Application	Reference
Macrophages (mouse)	Detachment of cells that are otherwise difficult to detach	Application Note 1
Bone marrow cells & preadipocytes (human)	Cell surface protein preservation (flow cytometry)	Application Note 2
Microglia (rat)	Analysis (detachment and function)	Nakajima et al., 2001
Monocytes and macrophages (human)	Re-seeding/passaging	Collier et al., 2002
Monocytes and macrophages (human)	Activation & analysis (structural)	Gordon and Freedman, 2006
Basophilic cell line RBL-2H3 (rat)	Antigen-mediated degranulation measured by surface plasmon resonance	Yanase et al., 2007

Working with Cell Sheets

Cell sheets harvested from cultureware with Thermo Scientific Nunc UpCell Surface can be

- Analyzed *in vitro*, for example, by electron microscopy
- Re-plated to cultureware with UpCell Surface or traditional cell cultureware
- Used in different transplantation models
- Stacked on top of another cell sheet (see next section, Tissue Models - Cell Sheet Engineering)

The UpCell Surface enables harvesting of contiguous cell sheets with preserved cell polarization and held together by normal cell junctions and extracellular matrix. Grow your cells to confluence in cultureware with UpCell Surface, apply the supplied membrane (only Cat. Nos. 174901 6 well multidish and 174904 3.5 cm dish), reduce the temperature, and harvest the cell sheet. It is that easy!

Anchorage-dependent cells in culture initially attach to proteins adsorbed to the cultureware from the medium, and produce and deposit a subcellular matrix during the course of the cultivation (Brevig et al., 2006; Kushida et al., 1999; Pompe et al., 2003). Cells in culture are held together by cell junctions and the matrix deposited by the cells. Traditional enzymatic or mechanical harvesting disrupts these cell-to-cell and cell-to-matrix contacts, as well as the subcellular matrix, and destroys the integrity and polarization of the culture. With the UpCell Surface, cells can be detached as contiguous sheets from the cultureware. The subcellular matrix and the supplied membrane provides the mechanical strength necessary for the handling of the detached cell sheet.

Cell Туре	Application	Reference
Aortic endothelial cells (cow)	Analysis (structural and matrix deposition)	Kushida et al., 1999
Keratinocytes (human)	Analysis (electron microscopy)	Yamato et al., 2001

Periodontal ligament cells (human)	Transplantation	Hasegawa et al., 2005

Examples of applications using cell sheets harvested by temperature reduction

Working with Tissue Models - Cell Sheet Engineering

Cell sheet constructs prepared in cultureware with Thermo Scientific Nunc UpCell Surface can be

- Analyzed in vitro, for example, by functional tissue-specific tests
- Cultivated in vitro, for example, as 3D co-cultures
- Used in different transplantation models, where cell sheets are stacked before or during the transplantation procedure

The UpCell Surface enables harvested cell sheets to be stacked in order to form 3D tissue models. Grow your cells to confluence in cultureware with UpCell Surface, harvest the cell sheet, and transfer the cell sheet to another cell sheet. No scaffold is needed!

Stacking of cell sheets, also known as Cell Sheet Engineering, was pioneered by Okano and colleagues (Yamada et al., 1990; Yang et al., 2005 and 2007). The preserved subcellular matrix of a harvested cell sheet provides the adhesive necessary for stacking. It functions as a natural glue to bond the cell sheet to an underlying recipient cell sheet or to a recipient site in a transplantation model, without the use of fibrin glue or sutures.

Cell Type	Application	Reference

Examples of Cell Sheet Engineering using cell sheets harvested by temperature reduction

Quality Assurance

Quality is inherent in our culture. From product development and sourcing raw materials to manufacturing and customer service, quality is reflected in every Thermo Scientific Nunc product.

A certificate of quality is packed in each box of cultureware with Thermo Scientific Nunc UpCell Surface. This certificate is your guarantee that the product has been validated according to the following tests:

Cell growth

Each manufacturing lot is sampled and subjected to performance testing for growth with the 3T3-Swiss Albino cell line (derived from a mouse embryo fibroblast) in accordance with standard operating procedures. Acceptance level: minimum of 80% confluence.

Cell detachment

The manufacturing lot is sampled and subjected to performance testing for cell detachment by temperature reduction with the 3T3-Swiss Albino cell line in accordance with standard operating procedures. Adherent cells are detached by temperature decreasing treatment (under 32°C) and the degree of detachment is measured. Acceptance level: detachment of 50% or more of the cells.

Sterility

Sterility is obtained by using ethylene oxide gas according to ISO 11135-1 (Sterilization of health care products, Ethylene oxide, Part 1: Requirements for development, validation and routine control of a sterilization process for medical devices).

Non-pyrogenic

Representative samples of products with UpCell Surface are tested according to the principles of the LAL-test described in the FDA guidelines and certified nonpyrogenic with a documented endotoxin level of less than 20 endotoxin units/device (0.5 Endotoxin units/mL) as stated in the USP.

Toxicity

The material has successfully passed the USP biological reactivity Class VI test - 50°C (7 days implant). Cytotoxicity test according to ISO 10993-5: Biological evaluation of medical devices - Part 5: Tests for *in vitro* cytotoxicity.
